

ChronicCareIQ Helps Enable 3 Practices To Make Major Patient Outcomes

The Practices

“I feel like my provider is **more informed of my conditions**. Whenever I go in every month, he’s already looked over everything and he **already knows** what the situation is.”
Mary Ivy, Arcare patient

CCM Monitoring Flags Dangerous Trends, Enabling Timely Pacemaker Placement

The Beginning

Home Physicians Group enrolled a patient in the practice's CCM and RPM program who had **limited understanding of his conditions** and how to use a blood pressure monitor.

The Incident

As the patient submitted daily vital signs, the care team noticed concerning trends and called the patient. Ultimately, this led to **the life-saving placement of a pacemaker.**

Now

The patient now understands his diagnosis, medications, and how to monitor his readings. **He can now confidently manage his health,** and his team provides the consistent care that he needs.

“Early changes in his vitals let us know to step in. **That intervention led to a pacemaker.** Without it, this likely would've escalated into a critical event.”

**Emily Estevez, CMA, Patient Advocate
Specialist at Home Physicians Group**

Early Detection Through RiskIQ Helps Stop a Stroke in Progress

The Beginning

National Jewish Health enrolled a patient in their care management program who always talked about feeling sick. Soon after, **RiskIQ flagged a particularly bad blood pressure reading**, and the patient filled out the survey talking about feeling badly.

The Incident

After noticing the signs, the team advised the patient to go the ED. The emergency team discovered the **patient was in the middle of a stroke**, and administered TPA.

Now

The patient recovered from the stroke thanks to the early intervention from the team. Without those early warning signs, the patient's situation could easily have become critical.

"A patient told us, 'I feel so good knowing that National Jewish is paying attention to my health, even when I'm not.'"

Erica Kaye, Executive Director of Ambulatory Practice, National Jewish Health

Stopping Medication Confusion From Becoming a Crisis

The Beginning

As the day was winding down, Arcare was alerted to a patient with **severely low blood pressure**. When they called, the patient could barely speak after answering the phone.

The Incident

They discovered **the patient had been taking their medication all at once**, instead of multiple times throughout the day as directed. Arcare provided instructions to the patient to reverse the overdose.

Now

The **patient now understands how to take her medication** as directed and has a method to remember to take it at the correct time. With the low blood pressure alert, Arcare would not have been able to assist the patient during that critical window.

“Patients feel like they can trust me because **I do what I say I’m going to do**. You really get to know them and their needs.”

Kimberely Gann, Arcare nurse and CCM patient
